Laboratory work №2

1.1 Work purpose

Study nmap utility with help of Kali Linux and Metasploitable2 VM.

1.2 Task

1. List targets to scan.
2. Probe open ports to determine service/version info.
3. Study nmap-services, nmap-os-db, nmap-service-probes.
4. Add new service to nmap-service-probes (create a minimal tcp server, get its name and version by nmap).
5. Study nmap stages and modes using Wireshark.
6. Output to xml-format file.
7. Perform VM Metasploitable2 scanning using db_nmap from metasploitframework.
8. Get some records from nmap-service-probes and describe them. Choose one Nmap Script and describe it.

1.3 Work Progress

1.3.1 Introduction

Nmap uses raw IP packets in novel ways to determine what hosts are available on the network, what services (application name and version) those hosts are offering, what operating systems (and OS versions) they are running, what type of packet filters/firewalls are in use, and dozens of other characteristics. It was designed to rapidly scan large networks, but works fine against single hosts. Nmap runs on all major computer operating systems, and official binary packages are available for Linux, Windows, and Mac OS X.

1.3.2 Creating connection

We used three operating systems at this laboratory work:

1. **Kali Linux** – VM, IP: 192.168.56.102
2. **Metasploitable 2** – VM, IP: 192.168.56.101
3. **Windows 10** – Real, IP: 192.168.56.1

The following code obtains the network configuration for Kali Linux:

```
1 root@kali:~# ifconfig
2 eth0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
3     inet 192.168.56.102 netmask 255.255.255.0 broadcast 192.168.56.255
4     inet6 fe80::a00:27ff:fe81:b1df prefixlen 64 scopeid 0x20<link>
5     ether 08:00:27:81:b1:df txqueuelen 1000 (Ethernet)
6     RX packets 7 bytes 1787 (1.7 KiB)
7     RX errors 0 dropped 0 overruns 0 frame 0
8     TX packets 16 bytes 2312 (2.2 KiB)
9     TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
10
11 lo: flags=73<UP,LOOPBACK,RUNNING> mtu 65536
12     inet 127.0.0.1 netmask 255.0.0.0
13     inet6 ::1 prefixlen 128 scopeid 0x10<host>
14     loop txqueuelen 1000 (Local Loopback)
15     RX packets 24 bytes 1440 (1.4 KiB)
16     RX errors 0 dropped 0 overruns 0 frame 0
17     TX packets 24 bytes 1440 (1.4 KiB)
18     TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
```

Network configuration for Metasploitable 2:

```
msfadmin@metasploitable:~$ ifconfig
eth0      Link encap:Ethernet  HWaddr 08:00:27:7e:e4:cc
          inet addr:192.168.56.101 Bcast:192.168.56.255 Mask:255.255.255.0
          inet6 addr: fe80::a00:27ff:fe7e:e4cc/64 Scope:Link
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:276 errors:0 dropped:0 overruns:0 frame:0
          TX packets:442 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:27731 (27.0 KB)  TX bytes:89510 (87.4 KB)
          Base address:0xd010 Memory:f0000000-f0020000

lo        Link encap:Local Loopback
          inet addr:127.0.0.1 Mask:255.0.0.0
          inet6 addr: ::1/128 Scope:Host
          UP LOOPBACK RUNNING  MTU:1636  Metric:1
          RX packets:118 errors:0 dropped:0 overruns:0 frame:0
          TX packets:118 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:31841 (31.0 KB)  TX bytes:31841 (31.0 KB)
```

Рис. 1.1: Metasploitable 2 network configuration

Let's try to check connection between Kali and Metasploitable 2 by the browser:

Рис. 1.2: Connection from Kali to Metasploitable 2 established

Ping also going well:

```
msfadmin@metasploitable:~$ ping 192.168.56.102
PING 192.168.56.102 (192.168.56.102) 56(84) bytes of data:
64 bytes from 192.168.56.102: icmp_seq=1 ttl=64 time=0.166 ms
64 bytes from 192.168.56.102: icmp_seq=2 ttl=64 time=0.263 ms
64 bytes from 192.168.56.102: icmp_seq=3 ttl=64 time=0.238 ms
```

Рис. 1.3: Connection from Metasploitable 2 to Kali established

1.3.3 List targets to scan

Let's start scanning Metasploitable 2 OS by the **nmap** utility. Option **-n** initiates fast scan (without port scanning). The main argument of the nmap utility is IP address (or range) of the remote host.

```
1 root@kali:~# nmap -sn 192.168.56.101
2
3 Starting Nmap 7.60 ( https://nmap.org ) at 2017-11-05 14:24 EST
4 Nmap scan report for 192.168.56.101
5 Host is up (0.00015s latency).
6 MAC Address: 08:00:27:7E:E4:CC (Oracle VirtualBox virtual NIC)
7 Nmap done: 1 IP address (1 host up) scanned in 13.28 seconds
```

1.3.4 Probe open ports to determine service/version info

Option **-top-ports** searches for the most used ports of the remote machine. Let's compare the result of nmap utility for the Metasploitable 2 OS and Windows 10 OS.

```
1 root@kali:~# nmap -top-ports 5 192.168.56.101
2
3 Starting Nmap 7.60 ( https://nmap.org ) at 2017-11-05 14:29 EST
4 Nmap scan report for 192.168.56.101
5 Host is up (0.00014s latency).
6
7 PORT      STATE SERVICE
8 21/tcp    open  ftp
9 22/tcp    open  ssh
10 23/tcp    open  telnet
11 80/tcp    open  http
12 443/tcp   closed https
13 MAC Address: 08:00:27:7E:E4:CC (Oracle VirtualBox virtual NIC)
```

```

14
15 Nmap done: 1 IP address (1 host up) scanned in 13.55 seconds
16
17
18 root@kali:~# nmap -top-ports 5 192.168.56.1
19
20 Starting Nmap 7.60 ( https://nmap.org ) at 2017-11-05 14:33 EST
21 Nmap scan report for 192.168.56.1
22 Host is up (0.0011s latency).
23
24 PORT      STATE      SERVICE
25 21/tcp    filtered  ftp
26 22/tcp    open       ssh
27 23/tcp    filtered  telnet
28 80/tcp    filtered  http
29 443/tcp   filtered  https
30 MAC Address: 0A:00:27:00:00:02 (Unknown)
31
32 Nmap done: 1 IP address (1 host up) scanned in 14.56 seconds

```

Metasploitable 2 has many vulnerabilities, including open ports without filtering. At the same time Windows has a built-in firewall, that filters some nmap packets.

Option **-V** used to display versions of the protocols:

```

1 root@kali:~# nmap -sV -top-ports 5 192.168.56.101
2
3 Starting Nmap 7.60 ( https://nmap.org ) at 2017-11-05 14:56 EST
4 Nmap scan report for 192.168.56.101
5 Host is up (0.00014s latency).
6
7 PORT      STATE  SERVICE VERSION
8 21/tcp    open   ftp      vsftpd 2.3.4
9 22/tcp    open   ssh      OpenSSH 4.7p1 Debian 8ubuntu1 (protocol 2.0)
10 23/tcp    open   telnet   Linux telnetd
11 80/tcp    open   http     Apache httpd 2.2.8 ((Ubuntu) DAV/2)
12 443/tcp   closed https
13 MAC Address: 08:00:27:7E:E4:CC (Oracle VirtualBox virtual NIC)
14 Service Info: OSs: Unix, Linux; CPE: cpe:/o:linux:linux_kernel
15
16 Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
17 Nmap done: 1 IP address (1 host up) scanned in 19.84 seconds
18
19
20 root@kali:~# nmap -sV -top-ports 5 192.168.56.1
21
22 Starting Nmap 7.60 ( https://nmap.org ) at 2017-11-05 14:57 EST
23 Nmap scan report for 192.168.56.1
24 Host is up (0.00015s latency).
25
26 PORT      STATE  SERVICE VERSION
27 21/tcp    filtered  ftp
28 22/tcp    open     ssh      Microsoft Windows IoT sshd 1.100 (protocol 2.0)
29 23/tcp    filtered  telnet
30 80/tcp    filtered  http
31 443/tcp   filtered  https
32 MAC Address: 0A:00:27:00:00:02 (Unknown)
33 Service Info: OS: Windows 10 IoT Core; CPE: cpe:/o:microsoft:windows_10:::iot_core
34
35 Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
36 Nmap done: 1 IP address (1 host up) scanned in 14.91 seconds

```

This experiment shows that remote attackers can get a lot of information about the system, so to ensure security, you must use a firewall.

1.3.5 Study nmap-services, nmap-os-db, nmap-service-probes

The utility files for nmap can be found in the directory `/usr/share/nmap`.

The **nmap-services** file is a registry of port names to their corresponding number and protocol. Each entry has a number representing how likely that port is to be found open. Most lines have a comment as well. Nmap ignores the comments, but users sometimes grep for them in the file when Nmap reports an open service of a type that the user does not recognize.

```
1 root@kali:~# cat /usr/share/nmap/nmap-services
2 tcpmux 1/tcp 0.001995 # TCP Port Service Multiplexer [rfc-1078] | TCP Port Service
   Multiplexer

28 qotd 17/tcp 0.002346 # Quote of the Day
29 qotd 17/udp 0.009209 # Quote of the Day
30 < ... >
```

The **nmap-os-db** data file contains hundreds of examples of how different operating systems respond to Nmap's specialized OS detection probes. It is divided into blocks known as fingerprints, with each fingerprint containing an operating system's name, its general classification, and response data.

```
1 root@kali:~# cat /usr/share/nmap/nmap-os-db

While the version of `nmap-services` distributed with Nmap is sufficient for most users, understanding the file format allows advanced Nmap hackers to add their own services to the detection engine. Like many Unix files, **nmap-service-probes** is line-oriented. Lines starting with a hash (`#`) are treated as comments and ignored by the parser. Blank lines are ignored as well. Other lines must contain one of the directives described below.

[illegible]

```

1.3.6 Add new service to nmap-service-probes

Let's start simple TCP echo server by the following C++ code:

```

1 #include <arpa/inet.h>
2 #include <netinet/in.h>
3 #include <stdio.h>
4 #include <pthread.h>
5 #include <string.h>
6 #include <stdlib.h>
7 #include <unistd.h>
8 #include <sys/types.h>
9 #include <signal.h>
10 #include <map>
11
12 #define PORT 65100
13
14 #define BACKLOG 5
15 #define BUFFER_SIZE 1000
16 #define FLAGS 0
17
18 // Коллекция для хранения пар значений:
19 // сокет + идентификатор потока

```

```

20 std::map<int, pthread_t> threads;
21 // Серверный сокет
22 int serverSocket;
23
24 // Обработчик сигнала прерывания корректное( завершение приложения)
25 void signalHandler(int sig);
26 // Обработчик клиентского потока
27 void* clientExecutor(void* clientSocket);
28 // Функция считывания строки символов с клиента
29 int readLine(int socket, char* buffer, int bufferSize, int flags);
30 // Функция отправки строки символов клиенту
31 int sendLine(int socket, char* buffer, int flags);
32 // Корректное закрытие сокета
33 void closeSocket(int socket);
34 // Завершение работы клиентского потока
35 void destroyClient(int socket);
36
37 int main(int argc, char** argv) {
38     int port = PORT;
39     if(argc < 2)
40         printf("Using default port: %d.\n", port);
41     else
42         port = atoi(argv[1]);
43
44     // Создание серверного сокета
45     serverSocket = socket(AF_INET, SOCK_STREAM, IPPROTO_TCP);
46     if(serverSocket < 0) {
47         perror("It's impossible to create socket");
48         return 0x1;
49     }
50
51     printf("Server socket %d created.\n", serverSocket);
52
53     // Структура, задающая адресные характеристики
54     struct sockaddr_in info;
55     info.sin_family = AF_INET;
56     info.sin_port = htons(port);
57     info.sin_addr.s_addr = htonl(INADDR_ANY);
58
59     // Биндим сервер на определенный адрес
60     int serverBind = bind(serverSocket, (struct sockaddr *) &info, sizeof(info));
61     if(serverBind < 0) {
62         perror("It's impossible to bind socket");
63         return 0x2;
64     }
65
66     // Слушаем сокет
67     int serverListen = listen(serverSocket, BACKLOG);
68     if(serverListen != 0) {
69         perror("It's impossible to listen socket");
70         return 0x3;
71     }
72
73     // Обработка прерывания для корректного завершения приложения
74     signal(SIGINT, signalHandler);
75
76     printf("Wait clients.\n");
77
78     while(1) {
79         // Ждем подключения клиентов
80         int clientSocket = accept(serverSocket, NULL, NULL);
81
82         // Пробуем создать поток обработки клиентских сообщений
83         pthread_t thread;
84         int result = pthread_create(&thread, NULL, clientExecutor, (void *) &clientSocket);
85         if(result) {

```

```

86     perror("It's impossible to create new thread");
87     closeSocket(clientSocket);
88 }
89
90 // Добавляем в коллекцию пару значений: сокет + идентификатор потока
91 threads.insert(std::pair<int, pthread_t>(clientSocket, thread));
92 }
93
94 return 0x0;
95 }
96
97 void signalHandler(int sig) {
98     // Для всех элементов коллекции
99     for(std::map<int, pthread_t>::iterator current = threads.begin(); current != threads.
100         end(); ++current) {
101         printf("Try to finish client with socket %d\n", current->first);

103         closeSocket(current->first);
104         printf("Client socket %d closed.\n", current->first);
105     }
106     // Закрываем серверный сокет
107     closeSocket(serverSocket);
108     printf("Server socket %d closed.\n", serverSocket);
109
110     exit(0x0);
111 }
112
113 void* clientExecutor(void* socket) {
114     int clientSocket = *((int*) socket);
115
116     printf("Client thread with socket %d created.\n", clientSocket);
117
118     char buffer[BUFFER_SIZE];
119     while(1) {
120         // Ожидаем прибытия строки
121         int result = readLine(clientSocket, buffer, BUFFER_SIZE, FLAGS);
122         if(result < 0)
123             destroyClient(clientSocket);
124
125         if(strlen(buffer) <= 1)
126             destroyClient(clientSocket);
127
128         printf("Client message: %s\n", buffer);
129
130         // Отправляем строку назад
131         result = sendLine(clientSocket, buffer, FLAGS);
132         if(result < 0)
133             destroyClient(clientSocket);
134     }
135 }
136
137 int readLine(int socket, char* buffer, int bufferSize, int flags) {
138     // Очищаем буфер
139     bzero(buffer, bufferSize);
140
141     char resolvedSymbol = ' ';
142     for(int index = 0; index < BUFFER_SIZE; ++index) {
143         // Считываем по одному символу
144         int readSize = recv(socket, &resolvedSymbol, 1, flags);
145         if(readSize <= 0)
146             return -1;
147         else if(resolvedSymbol == '\n')
148             break;
149         else if(resolvedSymbol != '\r')
150             buffer[index] = resolvedSymbol;

```

```

151 }
152
153 return 0x0;
154 }
155
156 int sendLine(int socket, char* buffer, int flags) {
157     unsigned int length = strlen(buffer);
158
159     // Перед отправкой сообщения добавляем в конец перевод строки
160     if(length == 0)
161         return -1;
162     else if(buffer[length - 1] != '\n') {
163         if(length >= BUFFER_SIZE)
164             return -1;
165         else
166             buffer[length] = '\n';
167     }
168
169     length = strlen(buffer);
170
171     // Отправляем строку клиенту
172     int result = send(socket, buffer, length, flags);
173     return result;
174 }
175
176 void closeSocket(int socket) {
177     // Завершение работы сокета
178     int socketShutdown = shutdown(socket, SHUT_RDWR);
179     if(socketShutdown != 0)
180         perror("It's impossible to shutdown socket");
181
182     // Закрытие сокета
183     int socketClose = close(socket);
184     if(socketClose != 0)
185         perror("It's impossible to close socket");
186 }
187
188 void destroyClient(int socket) {
189     printf("It's impossible to receive message from client or send message to client.\n");
190     // Завершение работы сокета
191     closeSocket(socket);
192     // Удаление пары значений из коллекции по ключю
193     threads.erase(socket);
194     printf("Client socket %d closed.\n", socket);
195     // Завершение работы потока
196     pthread_exit(NULL);
197 }
198 }

```

Compile and run the server on port 65100:

```

1 root@kali:~# mkdir temp
2 root@kali:~# cd temp/
3 root@kali:~/temp# touch server.cpp
4 root@kali:~/temp# gedit server.cpp
5 ^C
6 root@kali:~/temp# g++ -o server -pthread server.cpp
7 root@kali:~/temp# ./server
8 Using default port: 65100.
9 Server socket 3 created.
10 Wait clients.

```

Let's try to check **nmap** result before changes into nmap-service-probes file:

```

1 root@kali:~/temp# nmap -sV -p 65100 localhost
2
3 Starting Nmap 7.60 ( https://nmap.org ) at 2017-11-05 16:52 EST

```

```

4 Nmap scan report for localhost (127.0.0.1)
5 Host is up (0.000028s latency).
6 Other addresses for localhost (not scanned): ::1
7
8 PORT      STATE SERVICE VERSION
9 65100/tcp  open  unknown
10 1 service unrecognized despite returning data. If you know the service/version, please
    submit the following fingerprint at https://nmap.org/cgi-bin/submit.cgi?new-service :
11 SF-Port65100-TCP:V=7.60%I=7%D=11/5%Time=59FF8815%P=x86_64-pc-linux-gnu%(G

21 SF:dp\n");
22
23 Service detection performed. Please report any incorrect results at https://nmap.org/
    submit/ .
24 Nmap done: 1 IP address (1 host up) scanned in 105.15 seconds

```

The results indicate that it was not possible to determine the type of port and application.

The echo server displays information about requests coming to it. This illustrates the operating principle of the **nmap** utility: various requests are sent and depending on the response, the type of protocol is determined.

```

1 root@kali:~/temp# ./server
2 Using default port: 65100.
3 Server socket 3 created.
4 Wait clients.
5 Client thread with socket 4 created.
6 It's impossible to receive message from client or send message to client.
7 Client socket 4 closed.
8 Client thread with socket 5 created.
9 Client message: GET / HTTP/1.0
10 It's impossible to receive message from client or send message to client.
11 Client socket 5 closed.
12 Client thread with socket 4 created.
13 Client message: OPTIONS / HTTP/1.0
14 It's impossible to receive message from client or send message to client.
15 Client socket 4 closed.
16 Client thread with socket 5 created.
17 Client message: OPTIONS / RTSP/1.0
18 < ... >

```

The following code was added to the **nmap-service-probes** file, which will help **nmap** determine the type and version of the application:

```

1 < ... >
2
3 #####NEXT PROBE#####
4 # My TCP server.
5 Probe TCP my-tcp-server-ver q|version\r\n|
6 rarity 9
7 ports 65100
8 match echo m|^1\0\0$| p/My TCP Server/ v/1.0.0/

```

After this changes **nmap** successfully recognize the type of protocol:

```

1 root@kali:~/temp# nmap -sV -p 65100 localhost
2
3 Starting Nmap 7.60 ( https://nmap.org ) at 2017-11-05 16:56 EST
4 Nmap scan report for localhost (127.0.0.1)
5 Host is up (0.000027s latency).
6 Other addresses for localhost (not scanned): ::1

```

7	
8	PORT STATE SERVICE VERSION
9	65100/tcp open echo My TCP Server 1.0.0
10	
11	Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
12	Nmap done: 1 IP address (1 host up) scanned in 6.51 seconds

1.3.7 Study nmap stages and modes using Wireshark

Consider the network interaction of the utility nmap in the Wireshark program. Let's try to get 5 most used ports of Metasploitable 2 OS:

```
root@kali:~# nmap -sV -top-ports 5 192.168.56.101
```

No.	Time	Source	Destination	Protocol	Length	Info
7	52.717432094	192.168.56.102	192.168.56.101	TCP	58	48041 → 21 [SYN] Seq=0 Win=1024 Len=0 MSS=1460

Рис. 1.4: Trying to get 5 most used ports

Nmap tries to establish TCP connections with a lot of ports on the target system. If a packet with the RST flag is returned, the nmap concludes that the port is closed. If no response is received, then the port is filtered or does not exist.

Let's try to get information about the TCP server, that is running on port 65100:

```
msfadmin@metasploitable:~$ nmap -sV -p 65100 192.168.56.102
```

No.	Time	Source	Destination	Protocol	Length	Info
140	66.690921235	192.168.56.101	192.168.56.102	TCP	66	33581 → 65100

1.3.9 Perform VM Metasploitable2 scanning using db_nmap from metasploitframework

We can use the db_nmap command to run Nmap against our targets and our scan results would then be stored automatically in our database. However, if you also wish to import the scan results into another application or framework later on, you will likely want to export the scan results in XML format.

```
1 msf > db_nmap -v -sV 192.168.56.101
2 [*] Nmap: Starting Nmap 7.60 ( https://nmap.org ) at 2017-11-05 17:34 EST

72 [*] Nmap: Read data files from: /usr/bin/./share/nmap
73 [*] Nmap: Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
74 [*] Nmap: Nmap done: 1 IP address (1 host up) scanned in 26.09 seconds
75 [*] Nmap: Raw packets sent: 1001 (44.028KB) | Rcvd: 1001 (40.120KB)

```

1.3.10 Get some records from nmap-service-probes and describe them

Probe <protocol> <probenam> <probestring>

The Probe directive tells Nmap what string to send to recognize various services. All of the directives discussed later operate on the most recent Probe statement. The arguments are as follows:

- **<protocol>** – This must be either TCP or UDP. Nmap only uses probes that match the protocol of the service it is trying to scan.
- **<probenam>** – This is a plain English name for the probe. It is used in service fingerprints to describe which probes elicited responses.

- **<probestring>** – Tells Nmap what to send.

match <service> <pattern> [<versioninfo>]

The match directive tells Nmap how to recognize services based on responses to the string sent by the previous Probe directive. The arguments to this directive follow:

- **<service>** – This is simply the service name that the pattern matches.
- **<pattern>** – This pattern is used to determine whether the response received matches the service given in the previous parameter.
- **<versioninfo>** – actually contains several optional fields. Each field begins with an identifying letter (such as h for "hostname"). Next comes a delimiter character which the signature writer chooses.

rarity <value between 1 and 9>

The rarity directive roughly corresponds to how infrequently this probe can be expected to return useful results. The higher the number, the more rare the probe is considered and the less likely it is to be tried against a service.

ports <portlist>

This line tells Nmap what ports the services identified by this probe are commonly found on. It should only be used once within each Probe section.

1.3.11 Choose one Nmap Script and describe it

The Nmap Scripting Engine (NSE) is one of Nmap's most powerful and flexible features. It allows users to write (and share) simple scripts to automate a wide variety of networking tasks. Those scripts are then executed in parallel with the speed and efficiency you expect from Nmap. Users can rely on the growing and diverse set of scripts distributed with Nmap, or write their own to meet custom needs.

The following script starts all unit tests for the nmap utility and located at /usr/share/nmap/scripts/unittest.nse:

```

1 local stdnse = require "stdnse"
2 local unittest = require "unittest"
3
4 description = [[
5 Runs unit tests on all NSE libraries.
6 ]]
7
8 ---
9 --- @args unittest.run Run tests. Causes <code>unittest.testing()</code> to
10 --- return true.
11 ---
12 --- @args unittest.tests Run tests from only these libraries (defaults to all)
13 ---
14 --- @usage
15 --- nmap --script unittest --script-args unittest.run
16 ---
17 --- @output
18 --- Pre-scan script results:
19 --- | unittest:
20 --- |_ All tests passed
21
22 author = "Daniel Miller"
23
24 license = "Same as Nmap—See https://nmap.org/book/man-legal.html"
25
26 categories = {"safe"}
27
28
29 prerule = unittest.testing
30
31 action = function()
32     local libs = stdnse.get_script_args("unittest.tests")
33     local result

```

```

34  if libs then
35      result = unittest.run_tests(libs)
36  else
37      result = unittest.run_tests()
38  end
39  if #result == 0 then
40      return "All tests passed"
41  else
42      return result
43  end
44 end

```

This script contains the following fields:

- **description** – describes what a script is testing for and any important notes the user should be aware of.
- **author** – contains the script authors' names and can also contain contact information.
- **license** – helps ensure that we have legal permission to distribute all the scripts which come with Nmap.
- **categories** – defines one or more categories to which a script belongs.
- **prerule** – determines whether a script should be run against a target. Prerule run once, before any hosts are scanned, during the script pre-scanning phase.
- **action** – contains all of the instructions to be executed when the script's prerule, portrule, hostrule or postrule triggers.

1.4 Conclusion

Nmap is a free and open source utility for network discovery and security auditing. In this laboratory work, the main features of this utility were studied, and experiments were performed to illustrate its power. All these experiments show that remote attackers can get a lot of information about the system, so to ensure security, you must use a firewall.
